

## One tight example tying everything together

python

```
from PIL import Image      # module

img = Image.open("x.jpg") # instance created

img.rotate(90)              # method call
```

Breakdown:

- `PIL` -> package
- `Image` -> module
- `Image.Image` -> class (hidden inside module)
- `img` -> instance
- `rotate()` -> method
